INSIGHTS SUMMARY

“Shipment details”
Delivery orders takes about 4 days on average and all the five couriers are within .06 days of each other. Delivery speed is consistent but not that fast. But speed alone does not separate them.

Most shipments have been shipped in between 2024 – 2025 with 78% have been delivered, and 18% are still in Transit. Other statuses are not being updated rather than parcels are actually on the road.

“Delivery Issues”
J&T has the worse on both measures with 1.25% lost items, and 3.58% being returned. NinjaVan has the lowest lost rate of .84%. With 4.2% being the total lost and returned to sender.

Late deliveries, reports say that maybe it’s the customers expectations rather than actual courier delay.

“Loss Report”
Out of 15,000 orders, 1200 have been returned which is 8%, given that each return also costs shipping and handling.

Defective, Missing parts, Wrong item, Damaged item and Late delivery are about 70% from the total of 1200 (844 total). But there is also the 30% of Changed mind and Size issue.

Suggestions and recommendations.

Reduce controllable returns with better quality of items and packing checks before sending them out. 70% of returns are either ***“Defective, Missing Parts, Wrong item, or Damaged”***. Quick inspections are supposed to be done. Suggest we track a controllable return share, so the company should target a 20% reduction.

Review courier performance and fix tracking data. Highly suggest that a service review with J&T (highest lost and returned to sender rates) and must be compared to all four couriers. At the same time, enforce that shipment status delivery dates are updated so that “In Transit” and “Delivered” are assured.
